

Selectors are used to allow you to select and manipulate HTML elements.

ID selectors are used to change **unique** elements.

Class selectors are used to change **multiple** elements at the same time.

- 1 Inside the **<body>** tag, **edit** the **** tag and **add** an id attribute and name it as **"image"**. Your code will look like this.

```

```

- 2 **Edit** the title and description paragraph (**<p>**) and **add** a class attribute and name both **"text"**. Your code will look like this.

```
<p class="text" id="name">Ling Ling the Panda</p>
<p class="text" id="description">He is an awesome panda.</p>
```

- 3 **Add** an id attribute in the third button (**<button>**) tag and name it **"reset_button"**. Your code will look like this.

```
<button id="reset_button">Reset</button>
```
